AWS Cloud.Sprint

The fast track to the AWS Cloud in one package.

With the "AWS Cloud.Sprint" package, medium-sized companies can commission a cost-effective package solution for fast, but high-quality cloud migration. As part of a product and consulting package, Materna offers not only the migration of a workload, but also a migration readiness analysis with extensive reporting, the automated creation of a landing zone and account organisation, the migration of a first workload with the help of cloud tools, as well as the complete documentation of the migration.

Our offering

Migration Readiness Assessment (MRA)

In the MRA, we determine, document, and evaluate the maturity level of the company for cloud migration in various workshops. The customer receives concrete recommendations for action, which areas in the company should be further developed for optimal use of the AWS Cloud, which areas are already "Cloud Ready" and how the path for further migration to the Cloud can look.

Account and organisational structure

Based on the results of the first workshops, an organisational and account structure is defined in AWS Organizations together with the company, which reflects the company's internal requirements for compliance and security on the one hand, and transparency in cost accounting on the other.

LandingZone.Foundation

To have a high-quality starting point for further migration projects of the company, a landing zone is automatically provided, which represents the starting point for further migration to the cloud.

Target customers and requirements

Target customers

The Cloud.Sprint package is suitable for:

- Customers who have already taken the first steps in cloud migration but now want a "fresh start" with best practices.
- New cloud customers who do not yet have any cloud experience. Due to its structure, it is particularly suitable for medium-sized customers and ISVs.

Workload.Foundation

Within the framework of an immersion workshop, the analysis of an exemplary workload, the transfer of the configuration to the CMP and the rollout and final migration of the workload are tested with the customer. The application can then be put into production.

IaC.Foundation

The construction of the landing zone, account management and system management is fully automated. The code used in the process is handed over to the client.

Doc.Foundation

Together, a uniform standard is established for documenting the cloud environment, the guidelines, and procedures. All results of analyses, workshops and migrations are incorporated into this documentation.

Controls.Foundation

Using AWS Control Tower and AWS Systems Manager enables customers to centrally manage systems and compliance requirements.

Requirements

For the migration of mission-critical workloads to the cloud, a high-performance internet connection may need to be available.

Partial funding via AWS is possible.
